One of the most dangerous threats nowadays is spyware. Most of us have met annoying pop-up advertisements or we have been warned about attack or download of keylogger, dialer, hijacker or ad toolbar. Our anti-virus programs do not remove this problem. It's because spyware or adware is not a virus or a worm, they don't have self-replication feature and most of spyware can't damage computer system, except nukers. Anti-virus recognises only viruses and rarely recognises Trojans. Anti-virus would stop spyware or adware only if it would be infected with virus. Very often even firewalls can't help, because often when you install software it is bundled with spyware and so you without knowing it agree to have spyware on your PC.

The best way to prevent spyware and to protect your privacy is to get a really good anti-spyware software. There is a wide range of anti-virus spyware programs for your choice. You just need to decide which one to use. Some programs have different features so it's good to have two or even three anti-spyware programs. They would replenish each other. They are able to detect and remove (or prevent from) spyware, adware, pop-ups, browser hijackers and others typically problems that can't be prevented by anti-virus.

One of the choices could be TZ Spyware Adware Remover. It is very efficient program, because it provides effective although rather slow scan of the system. Database is very wide and updated so it can find and prevent you from newest spywares. It is user-friendly program. Here are more features:

- Realtime protection.
- Backup system. This enables users to restore deleted files.
- Pop-up blocking.
- Categorised scanning.

But on the other hand it's design and interface isn't very attractive. It lacks definitions of spyware that were found. And information is very complicated maybe only for programmers to understand. For average user there might be question about further actions when system scan is over.

Other very popular and in fact very good software is Spy Sweeper from Webroot. It provides realtime protection and scan. Using this you're safe from all known spyware and many less known parasites. It's effective tool from adware and pop-ups. Very important feature is scheduled scanning. But user is able to

scan system at any time he wants. Database is updated regularly.

BPS Spyware Remover Reviewer is one more product in anti-spyware market. this program has almost all common and required qualities of good anti-spyware. It has realtime protection, blocks pop-up ads and other adware, user-friendly usage and interface and provides protection from almost all known spyware thanks to comprehensive and regularly updated spyware database.

Very similar to mentioned program is SpyRemover, although it lacks realtime protection. Still this anti-spyware is great. It has very simple settings so it's very easy to use. It can detect and remove adware and spyware. User is able to restore deleted files. Database of spyware and adware is more that big. Users will be safe from all parasites.

And at last the best anti-spyware of 2005 that can be offered to you is Spyware Eliminator from Aluria. This software was acknowledged as the best among other anti-spyware programs. Spyware Eliminator provides effective realtime protection; provides the best protection from all known spyware and adware. It has regular automatic update feature. User-friendly program is easy understandable. Even a child or a common users would understand usage of Spyware Eliminator. It's essential that this software is the only anti-spyware that detects and removes keyloggers. Others anti-spyware programs are very ineffective in this case or even useless. And the bets is that the price of this software is rather low for this quality, when others programs are more expensive and less effective.
