There is a great amount of spyware, adware, etc., on Internet. That means that your privacy and security is in danger. Spyware is kind of a software, that cannot be detected with anti-virus program. Usually it doesn't damage your computer system, but there are certain cases when it does. Anyway the danger exists and much bigger than computer system's crash. Such things as spying, carding, identity theft are serious problems that may cause a lot of technical and financial problems. It may even end up with your arrest although you will not be guilty.

Along with this security problem, a new product came to market. It is anti-spyware software. Now there's a great number of these programs and if you're not a professional you can be confused trying to pick up the right one.

Before installing or buying the anti-spyware you should find out more information about software that you have chosen. Firstly all the anti-spyware must search your computer for certain files. It must identify different components. It should find all of these spyware:

-
- adware
-
- spyware
-
- keyloggers
-
- tracking cookies
-
- parasites
-
- Trojans
-
- malware
-
- dialers
-
- scumware

-
- Spyware Registry Keys
-
- Toolbars
-
- Active X Configuratio
-
- Data Mining
-
- Drive-By Download
-
- Browser Hijackers

Also it must have an auto update feature.

If you find that anti-spyware allows you to restore deleted files, you may consider this software as a better one. Better anti-spywares also show descriptions of founded spywares and infections, parasites. Some can even show the link to the spyware designer's web site.

Anti-spyware should also show the rate of risk of the infected files and spyware. Because you and not the software must decide to quarantine or to delete the infected file.

Scan scheduling must be available at your services.

You also have to look for cookies blocking real time protection. Anti-spyware must provide alerts whenever your computer is attacked. It's necessary for your privacy protection. It should provide protection for your e-mail also.

A good anti-spyware should also provide removable media scans.

Advanced features for good anti-spyware should be userfriendly usage and installing. It should warn you about your security before installing some unknown programs and not at the time when some parasites are already in your PC. If software provides some spyware definitions you must check if they are updated. And of course good software must have help support in a written form and online.

If you have found software with all of these qualities, you can be sure that it is really one of the best. If you haven't we can tell you that Spyware Eliminator is one of the best in this category. Also we can recommend you Spy Sweeper from Webroot, AntiSpy, SpyHunter, Ad-aware Professional, etc.
